An NGR consists of a resistor, a contactor, and a control unit. The resistor is connected between φ , the generator neutral and the ground. The contactor is a switch that can open or close the resistor circuit.

[NGR for Generator Protection: Benefits and Risks Explained](#)

NGR Sensing Resistors are attached φ , in parallel to the Neutral Grounding Resistor. The sensing resistor allows a protective relay which detects resistor failure in a φ , continuous manner. Sensing Resistors are used in combination with neutral grounding resistor monitor relays.
